PREFACE

This Occupational Survey Report (OSR) presents the results of a detailed Air Force occupational survey of the Aerospace Propulsion career ladder:

AFSC 454X0A - Aerospace Propulsion (Jet Engines) (Formerly AFSC 426X2 - Jet Engine Mechanic)

AFSC 454X0B - Aerospace Propulsion (Turboprop and Turboshaft Propulsion) (Formerly AFSC 426X3 - Turboprop Propulsion Mechanic)

AFSC 45490 - Aerospace Propulsion Superintendent (Formerly AFSC 42699 - Aircraft Propulsion Superintendent)

The specialties covered in this OSR were involved in a direct classification conversion as of 31 October 1988. All data on these specialties, however, were collected prior to the conversion. Thus, to avoid confusion, all data displays and discussion throughout the OSR will continue to use the old classification numbers. Authority for conducting occupational surveys is contained in AFR 35-2. Computer products used in this report are available for use by operations and training officials.

The survey instrument for this project was developed by Mr Donald Cochran, Inventory Developer. Technical Sergeant Joseph Seitz and Mr Wayne Fruge provided computer support for the project. First Lieutenant Jose E. Caussade, Occupational Analyst, analyzed the data and wrote the final report. Administrative support was provided by Mr Richard G. Ramos. This report has been reviewed by Lieutenant Colonel Charles D. Gorman, Chief, Airman Analysis Branch, USAF Occupational Measurement Center.

A Training Requirements Analysis (TRA) is being accomplished in conjunction with this OSR. The TRA will provide a comprehensive data base in support of career ladder training decisions. The TRA consists of three sections: (a) System Overview - an overall perspective of career ladder training; (b) Task Analysis - consisting of detailed training decision data for career ladder technical tasks; and (c) Training Requirements/Recommendations - giving recommendations on what should be trained, when training should occur, and where training should be provided.

Copies of this report are distributed to Air Staff sections, major commands, and other interested training and management personnel (see Distribution on page i). Additional copies are available upon request to the USAF Occupational Measurement Center, Attention: Chief, Occupational Analysis Division (OMY), Randolph Air Force Base, Texas 78150-5000.

Center

SUMMARY OF RESULTS

1. Survey Coverage: Survey results are based on responses from 5,427 AFSC 426X2, 426X3, and 42699 personnel. The sample was broken down into 4,206 AFSC 426X2 individuals and 1,010 AFSC 426X3 career ladder members. Additionally, 211 9-skill level (AFSC 42699) personnel participated in the survey sample.
2. Specialty Structure: Three major technical jobs, accounting for 59 percent of the total sample, and several smaller, more specialized jobs were identified. While diverse in the number of functional areas, personnel exhibit a good degree of uniformity in many of the tasks performed across the two AFSCs. Variations within these jobs were easily distinguished by career ladder and type of engine.
3. Career Ladder Progression: Each career ladder has 3- and 5-skill level personnel essentially performing the same functions. At the 7-skill level, while supervisory tasks are the most commonly performed tasks, most of their total job time is still spent in "hands on" technical duties. AFSC 42699 personnel have a very managerial job description consisting of many inspecting and evaluating type tasks. AFR 39-1 Specialty Descriptions are generally descriptive of the career ladder's responsibilities. Consideration should be given to removing maintenance of turbojet missile engine functions from the Descriptions.
4. Training Analysis: Due to the number of specific areas employing AFSC 426X2/X3 personnel, many items in each career ladder's STS and POI matched to tasks performed by low percentages of career ladder groups. Strict adherence to appropriate regulations would obligate these areas be removed from the training documents. Enough latitude is provided in the regulations, however, to set up alternative means of reviewing these documents. Subject-matter experts are encouraged to closely review these documents, using OSR data, to determine document areas needing improvement. Three-skill level proficiency codes in the STSs need to be examined to ensure good representative 3-skill level formal training is being provided. Additionally, each training document had several unreferenced tasks needing examination for possible inclusion.
5. Job Satisfaction: High levels of job satisfaction were noted in both career ladders. A few jobs, such as Technical Order and Nonpowered Support Equipment Personnel, displayed lower job satisfaction indicators than most other jobs.
6. Implications: The propulsion specialty exhibits some diversity in the functional areas in which personnel are employed. This affects the training documents which revealed several areas matched to tasks performed by low percentages of career ladder groups. A number of methods for reviewing these documents are discussed.

OCCUPATIONAL SURVEY REPORT
JET ENGINE/TURBOPROP PROPULSION
(AFSC 426X2/426X3, 42699)

INTRODUCTION

This report summarizes the results of an occupational survey of the Jet Engine/Turboprop Propulsion career ladders (AFSCs 426X2/426X3 and 42699). As a result of October 1988 Rivet Workforce initiatives, the two career ladders have converted into one multishred career ladder (AFSC 454X0A/B, Aerospace Propulsion). At the time of this report, however, the major result of this initiative has been an AFSC number change. Since the data were collected prior to the conversion, the narrative and all tables will use the old classification numbers.

The study was initiated to update career ladder tasks, to assist in reclassification actions, and to update career ladder training documents. Additionally, the survey will identify what "engine monitoring system" and "engine management" tasks are being performed. The previous OSR was published in April 1982.

Background

AFSC 426X2 (Jet Engine) personnel functions include inspecting, removing, installing, assembling, disassembling, troubleshooting, repairing, servicing, testing, and modifying turbojet, turbofan, and modular turbofan aircraft engines; auxiliary power units (APU); small gas turbine engines; and other associated equipment. AFSC 426X3 (Turboprop) personnel perform many of the same functions on turboprop and turboshaft aircraft engines, propellers, APUs and other associated equipment.

Initial 3-skill level training for AFSC 426X2 personnel is provided at Chanute AFB in a 9-week, 3-day course. Students are instructed in jet engine operating principles, engine change, adjustments and conditioning of jet engines and systems, and other jet engine repair aspects. At the start of Block III, trainees split into two different avenues. One track teaches the F100 engine, while the other track instructs on the J57 engine. Regardless of the training platform utilized, both tracks cover the same materiel in the instruction Block. After completion, students often go into engine-specific training on engines such as J85, TF33, and F100-PW-220 at the tech school.

AFSC 426X3 initial 3-skill level training is also conducted at Chanute AFB in a 10-week, 2-day course. In addition to training on repair and maintenance of turboprop engines, propeller maintenance is instructed. Airmen assigned to helicopter units get follow-on training at the tech school on helicopter turboshafts.

APPROVED FOR PUBLIC RELEASE; DISTRIBUTION UNLIMITED

SURVEY METHODOLOGY

Survey Development

Data for this survey were collected using USAF Job Inventory AFPT 90-426-842, dated March 1988. After reviewing pertinent career ladder publications and tasks from previous survey instruments, the inventory developer prepared a preliminary task list. This task list was then refined and validated through personal interviews with 191 subject-matter experts at 17 operational bases and one training base to ensure a comprehensive sample of the various functions performed within the AFSC 426X3/X3 career ladders. The locations selected for visits and the reasons for their selection are listed below:

Chanute AFB IL--Technical Training Center for AFSC 426X2/3
basic course

England AFB LA--TF34 (A-10) engine maintenance

Barksdale AFB LA--CF6 (F-103) (KC-10A) and J57 (B-52G)
engine maintenance

McConnell AFB KS--F108 (KC-135R) engine maintenance

Offutt AFB NE--CF6 (F-103) (E-4) and TF33 (EC-135) engine
maintenance

Ellsworth AFB SD--F101 (B-1) engine maintenance

Minot AFB ND--TF33 (B-52H) and J57 (KC-135A) engine
maintenance

Charleston AFB SC--TF33 (C141) engine maintenance

Dover AFB DE--TF39 (C-5) engine maintenance

Pease AFB NH--TF30 (FB-111) engine maintenance

Randolph AFB TX--J85 (T-38) and J69 (T-37) engine maintenance

Dyess AFB TX--T56 (C-130) engine maintenance

Kirtland AFB NM--T56 (C-130), T400 (HH-1N), T58 (HH-3E), and
T64 (HH-53) engine maintenance

Nellis AFB NV--F100 (F-15,16) and J85 (T-38) engine
maintenance

George AFB CA--J79 (F-4) and T76 (OV-10) engine maintenance

Mountain Home AFB ID--TF30 (F-111) engine maintenance

Beale AFB CA--J75 (U-2,TR-1) and J-58 (SR-71) engine maintenance

Travis AFB CA--TF39 (C-5) and TF33 (C-141) engine maintenance

The final job inventory consisted of 946 tasks, divided into 20 functional areas or duties. The inventory also contained a background section which includes questions on job title, mission, aircraft qualification, grade, and total active federal military service (TAFMS).

Survey Administration

From February through October 1988, survey control officers at Consolidated Base Personnel Offices worldwide distributed the inventory to AFSC 426X2, 426X3, and 42699 personnel. Participants were selected from a computer-generated mailing list provided by the Human Resources Laboratory.

To complete the survey, each incumbent first answered a series of background questions, then marked the tasks he or she performed. Finally, the incumbent rated each task performed according to the relative time spent performing that task. Ratings range from 1 (a very small amount of time spent) to 9 (a very large amount of time spent). As part of the computer analysis, all of an incumbent's ratings are combined and the total is assumed to represent 100 percent of the individual's time on the job. Each rating is then divided by this total and multiplied by 100 to give the relative percent time spent for each task. Using these figures, analysis compares tasks in terms of the relative percent time spent performing them.

Survey Sample

With over 10,000 AFSC 426X2 individuals eligible to receive a survey booklet, a random, stratified selection process was used to select career ladder members as survey participants and to ensure a proportional representation of major commands (MAJCOM) and military paygrades in the sample. Due to the smaller AFSCs 426X3 and 42699 career ladder sizes, all but those in training, hospital, or PCS status were selected to complete the job inventory. A total of 6,907 incumbents were randomly selected to complete the job inventory. This list of eligible personnel included an accurate representation across MAJCOMs. Table 1 reflects the distribution by MAJCOM and career ladder of personnel assigned to the career ladder as of April 1988, and of respondents in the survey sample. The 5,427 respondents in the final sample represent 79 percent of those receiving inventory booklets.

Task Factor Administration

In addition to collecting task performance data, part of the survey administration process involves collecting task factor ratings of task difficulty (TD) and training emphasis (TE). These ratings are collected from senior NCOs randomly selected to represent their career ladder and are processed separately from task performance data.

Task difficulty is defined as the length of time required for the average job incumbent to learn to do a task. To complete the TD booklet, each senior NCO rated inventory tasks with which they were familiar on a 9-point scale ranging from extremely low relative difficulty (a rating of 1) to extremely high relative difficulty (a rating of 9). Separate ratings were computed for each career ladder. The interrater reliability of the TD data provided by 88 AFSC 426X2 NCOs was acceptable, as was the interrater reliability provided by the 48 AFSC 426X3 NCOs. Each of these sets of TD ratings was adjusted to give a rating of 5.00 to a task of average difficulty, with a standard deviation of 1.00. Tasks rated 6.00 and above are considered high in task difficulty. The TD ratings provide a rank-ordered listing of the tasks in the inventory by degree of difficulty.

Training emphasis refers to the importance of structured training (through resident technical schools, field training detachments, formal OJT, etc.) of particular tasks for first-enlistment personnel. Individuals completing TE booklets rated tasks on a 10-point scale ranging from a blank (no training emphasis) to 9 (extremely heavy training required). The TE ratings provide a rank-ordered listing of tasks from high to low training emphasis. As was the case with TD ratings, separate ratings were computed for each shredout.

The interrater reliability for the 90 NCOs in the Jet Engine Propulsion career ladder was acceptable. The average TE rating was 1.72, with a standard deviation of 1.33. Tasks rated above 3.05 are considered high in training emphasis for AFSC 426X2 first-termers. The 37 AFSC 426X3 TE raters also had an acceptable interrater reliability, with an average TE rating of 1.59 and a standard deviation 1.37. Tasks above 2.96 are considered high in training emphasis for AFSC 426X3 first-enlistment personnel.

When used in conjunction with other information, such as percent members performing, TD and TE ratings can provide insight into training requirements. Such insight may help validate lengthening or shortening portions of instruction supporting AFSC-needed knowledges or skills.

SPECIALTY JOBS (Career Ladder Structure)

An important function of the USAF Occupational Analysis Program is examining a career ladder's structure. Based on incumbent responses to the survey, analysis identifies groups of incumbents spending similar amounts of time

performing similar tasks. Individuals performing many of the same tasks, and spending similar amounts of time on those tasks, group together to describe a job performed in the career ladder. In this way, analysis identifies the basic structure of the career ladder in terms of the jobs performed and their relationship to each other. This analysis provides a foundation for reviewing other aspects of the career ladder, such as personnel classification, AFR 39-1 Specialty Descriptions, and training considerations.

Specialty Structure Overview

The AFSC 426X2/X3 career ladders are diverse in the functional areas they encompass. Just three technical jobs encompass 59 percent of the sample. The remaining sample, however, is divided into 15 other smaller, more specialized jobs (not including the Supervisory Job). Airmen in both career ladders perform many of the same tasks. Each career ladder's basic duties revolve around the maintenance and repair of aircraft engines. Similarity between the two career ladders was thus great enough to warrant identifying jobs by functional area, as opposed to AFSC. Jobs will thus be listed as "Flightline Personnel," for example, as opposed to "Jet Engine Flightline Personnel" and "Turboprop Flightline Personnel." Primary differences between the two career ladders lie in engine-specific areas. For example, AFSC 426X2 personnel do not normally work on propellers, while few AFSC 426X3 personnel perform tasks dealing with afterburners. Variations existed within many of the jobs, often by engine type. Variations are defined as clearly identifiable functions within a job that are not different enough to be broken out into separate jobs. The three major jobs mentioned above are In-Shop, Flightline, and Test Cell Personnel. Many of the other identified jobs are smaller, more specialized areas, often functionally grouped in the career ladders under the shop or flightline areas. In the following discussion, the stage (STG) or group (GPO) number refers to computer-printed information. Figure 1 illustrates the jobs identified in this survey.

- I. CROSS UTILIZATION TRAINING (CUT) PERSONNEL (STG0289)
- II. IN-SHOP PERSONNEL (GPO0096)
- III. PHASE DOCK PERSONNEL (STG0231)
- IV. TEST CELL PERSONNEL (STG0354)
- V. FLIGHTLINE PERSONNEL (STG0283)
- VI. BALANCE SHOP PERSONNEL (STG0270)
- VII. AFTERBURNER/AUGMENTOR MODULE PERSONNEL (GPO0097)
- VIII. ACCESSORY REPAIR PERSONNEL (STG0055)
- IX. QUALITY ASSURANCE PERSONNEL (STG0264)

AFSC 426X2/X3 SPECIALTY JOBS

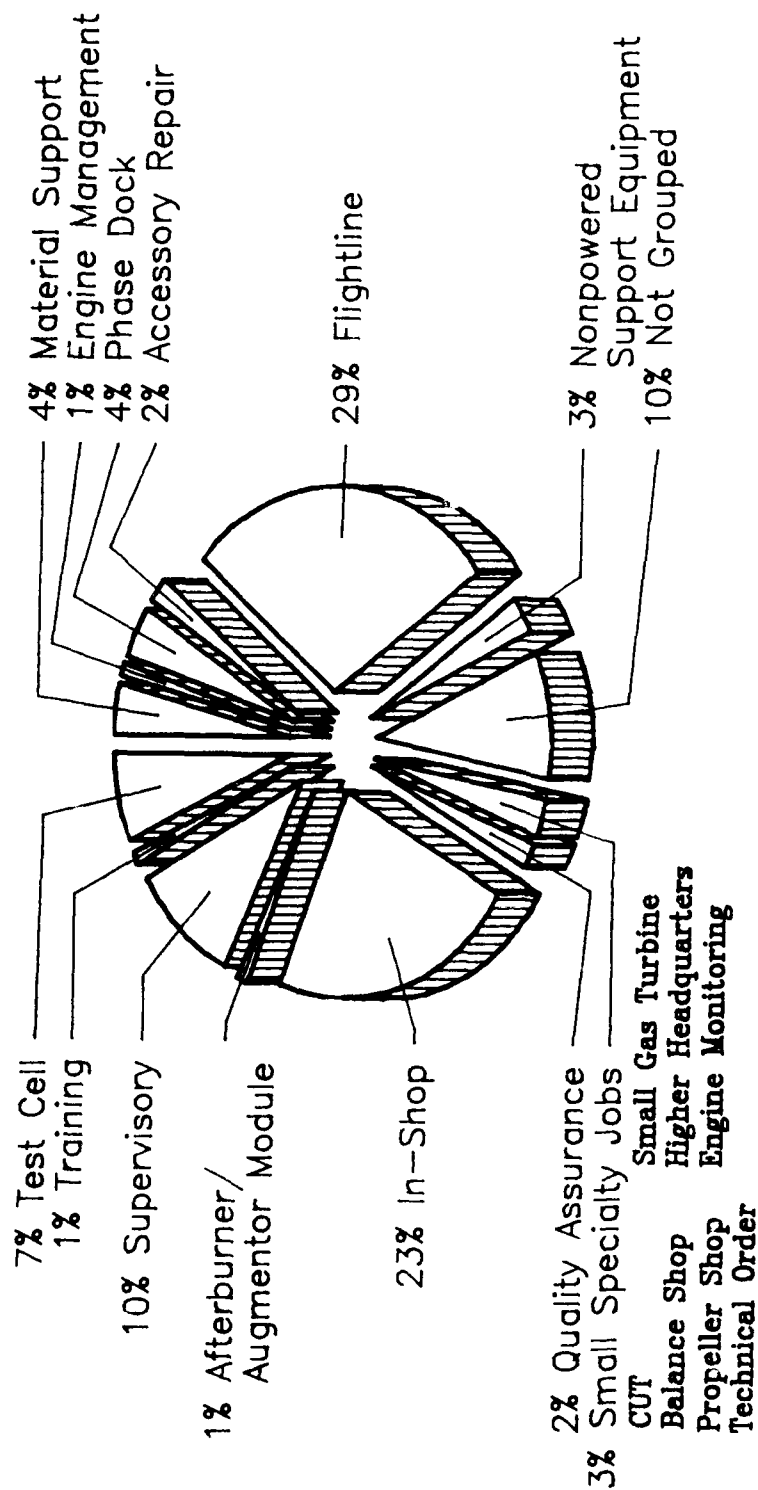

Figure 1

- X. SUPERVISORY PERSONNEL (STG0126)
- XI. TRAINING PERSONNEL (STG0037)
- XII. NONPOWERED SUPPORT EQUIPMENT PERSONNEL (STG0125)
- XIII. MATERIAL SUPPORT PERSONNEL (STG0110)
- XIV. PROPELLER SHOP PERSONNEL (STG1487)
- XV. SMALL GAS TURBINE PERSONNEL (STG0312)
- XVI. TECHNICAL ORDER PERSONNEL (STG0255)
- XVII. HIGHER HEADQUARTERS PERSONNEL (STG0267)
- XVIII. ENGINE MONITORING PERSONNEL (STG0067)
- XIX. ENGINE MANAGEMENT PERSONNEL (STG0095)
- XX. NOT GROUPED

Ninety percent of the survey respondents grouped into the above jobs. The remaining sample did not perform functions similar enough to group together or performed so few tasks in the inventory that their job could not be described.

Group Descriptions

The following paragraphs briefly describe the different jobs identified in the analysis. Table 2 provides selective background data on these jobs. For a more detailed listing of representative tasks and a summary of background data on these jobs, see Appendix A.

I. CROSS UTILIZATION TRAINING (CUT) PERSONNEL (STG0289). Personnel in this job perform tasks outside the normal engine maintenance duties. Instead of engine maintenance and repair, these individuals spend the majority of their total job time (58 percent) performing cross-utilization training tasks. These are tasks normally performed by personnel in other career ladders. Many AFSC 426X2/X3 personnel perform these tasks as part of an initiative to better utilize personnel and tasks on the flightline. This job averages a small number of tasks (28 tasks). Representative tasks include:

- ground aircraft
- position or remove aircraft chocks or pins
- connect or disconnect external aircraft power

** Only predominant MAJCOMs displayed

walk wings or tails during aircraft towing operations
launch or recover aircraft
tow aircraft, other than to and from trim pads

These personnel average over 6 years TAFMS. The job was equally divided between AFSCs 426X2 and 426X3 mechanics, with most being qualified at the 5-skill level.

II. IN-SHOP PERSONNEL (GPO0096). The airmen working in this large job perform buildup and teardown servicing of engines that have been removed from the aircraft and taken to the engine shop. Most of the intensive engine repair work is done in this job. As such, the majority of In-Shop Personnel tasks involve performing general aircraft and in-shop engine maintenance tasks (82 percent of total job time). Several of these tasks involve removing and installing aircraft engine components. This group performs an average of 105 tasks. Representative tasks include:

seal, plug, or cap lines or openings
remove or install engine plumbing
remove or install engine fuel system components
remove or install engine fuel manifolds or nozzles
remove or install engine bearings
inspect engine plumbing

A number of variations were uncovered in this job. Most revolved around engine type. Examples of some of these engine job variations include the different F-100 series, J-57, J-69, T-56, and TF-39. Other noted job variations include Small Gas Turbine Personnel and Field Training Detachment (FTD) Personnel. FTD Personnel are grouped in this job due to the engine repair tasks they perform as part of their training function.

These personnel average over 5 years TAFMS. Sixty-one percent of this group were DAFSC 42652 personnel. Eight percent of the job was made up of AFSC 426X3 personnel.

III. PHASE DOCK PERSONNEL (STG0231). This job is normally an aspect of flightline responsibilities. Phase Dock Personnel perform periodic inspections on aircraft engines and some servicing and maintenance on those engines. They perform an average of 70 tasks, some of which include:

inspect engine oil filters
inspect engine plumbing
perform engine leak checks
inspect fuel filters

- seal, plug, or cap lines or openings
- service engine oil systems
- remove or install engine plumbing

Personnel in this job average just over 5 years TAFMS. Ninety-eight percent were AFSC 426X2, and 65 percent were 5-skill level qualified in this career ladder.

IV. TEST CELL PERSONNEL (STG0354). Airmen in this job test engines that have been repaired to ascertain the quality of repair and check engine performance. They also perform some minor maintenance, make required adjustments to engines, and record data necessary to determine engine condition. Seventeen percent of their total job time is spent performing test cell tasks. These individuals perform a large job averaging 142 tasks. Examples include:

- remove or install engines in test stands
- perform engine leak checks
- service engines in test cells
- connect or disconnect test equipment to engines
- inspect engines before and after installation in test cells
- analyze engine operation data during test cell runs
- service engine oil systems

A little over 7 years is the average TAFMS for personnel in this job. Fifty-three percent are 5-skill level qualified in the AFSC 426X2 career ladder, while 34 percent hold a AFSC 42672 skill level. The Turboprop career ladder made up 9 percent of the job.

V. FLIGHTLINE PERSONNEL (STG0283). Personnel in this largest sample job perform engine maintenance and repair on aircraft on the flightline. Performing general aircraft and flightline engine maintenance tasks account for 64 percent of their total job time. Personnel in this job perform a very large job averaging 155 tasks. Some representative tasks include:

- perform engine leak checks
- seal, plug, or cap lines or openings
- remove or install engine fuel system components
- inspect engine plumbing
- remove or install engine oil system components
- service engine oil systems
- inspect engine oil filters

This job contains individuals averaging just over 7 years TAFMS. Sixty-five percent of the personnel in this job are AFSC 426X2 personnel. AFSC 426X3 individuals constitute the remaining 35 percent. As a result of Rivet Workforce, Tactical Air Force (TAF) flightline incumbents have been converted

to AFSC 452X4, Tactical Aircraft Maintenance. This supports their "crew chief" maintenance operations. Personnel in the propulsion specialty affected by this conversion will retain AFSC 454X0 as a secondary AFSC.

VI. BALANCE SHOP PERSONNEL (STG0270). Often included in the shop area, personnel in this job are primarily responsible for performing rotating engine assembly weight and balance functions. This duty accounts for 23 percent of their total job time. They perform an average of 61 tasks. Some representative tasks include:

- blend engine compressor blades
- inspect engine compressors
- remove or install compressor blades
- perform permanent balance corrections on compressor rotors
- measure stator vane tip radii
- dynamically balance compressors

Balance Shop job members are among the most junior individuals, averaging 4 years TAFMS. All are AFSC 426X2 personnel, with 3- and 5-skill level individuals each making up 42 percent of the job. ATC is the major utilizing command, comprising 74 percent of the job.

VII. AFTERBURNER/AUGMENTOR MODULE PERSONNEL (GP00097). This job includes personnel working on either conventional or module engines. These individuals work on the afterburners or augmentors module sections of aircraft engines. Performing general and in-shop aircraft engine maintenance accounts for 71 percent of their total job time. These career ladder members perform an average of 45 tasks. Representative tasks include:

- inspect afterburners or augmentors
- repair afterburners or augmentors
- assemble or disassemble afterburners or augmentors
- remove or install afterburner or augmentor system components
- adjust afterburner or augmentor nozzle areas
- rig afterburner or augmentor systems

Primarily junior people group into this job, averaging just under 3 1/2 years TAFMS. The majority of personnel in this job (99 percent) are AFSC 426X2 personnel, with 76 percent being qualified as DAFSC 42652 personnel. Eighty-eight percent are utilized by TAF forces (TAC, PACAF, USAFE, and AAC).

VIII. ACCESSORY REPAIR PERSONNEL (STG0055). These job incumbents primarily work on engine accessory systems, such as fuel nozzles, fuel manifolds, and gearboxes. The accessories maintained often depend on the type of engine

utilized. For example, individuals maintaining TF33 engines work on thrust reverser systems, but this would not be the case if they maintained J85 engines. Accessory Repair Personnel perform a very limited job averaging only 37 tasks. Representative tasks include:

- inspect accessory gearboxes
- repair engine gearboxes
- perform operational checks of fuel manifolds
- inspect engine fuel manifolds
- remove or install engine reduction gearbox assembly components
- remove or install thrust reverser assembly components

Variations in accessories maintained revolved around different engine types. These variations included T56, J85, J57, and TF33 engines. Personnel in this job have an average TAFMS of 4 years. Sixty-four percent belong to the DAFSC 42652 specialty, while 16 percent are AFSC 426X3 career ladder members. Fifty-four percent are utilized by MAC.

IX. QUALITY ASSURANCE PERSONNEL (STG0264). These job members have responsibility for determining aircraft and equipment condition and personnel proficiency. Performing these quality assurance tasks accounts for 25 percent of their total job time. Their tasks are highlighted by many inspecting and evaluating tasks. They perform an average of 69 tasks, including:

- perform quality visual inspections of engines
- inspect flightline maintenance actions
- inspect in-shop maintenance actions
- inspect engines or associated equipment for corrosion
- review Technical Order (TO) changes
- perform activity inspections

As could be expected, personnel in this job are more senior than most, averaging almost 14 years TAFMS. Sixty-four percent are DAFSC 42672 personnel and 17 percent are 7-skill level qualified in the AFSC 426X3 career ladder.

X. SUPERVISORY PERSONNEL (STG0126). These are the NCOICs and supervisors of the two career ladders whose major duties are supervisory and administrative in nature. Sixty-three percent of their total job time is spent performing these supervisory and administrative functions. Personnel holding this job perform an average of 81 tasks. Representative tasks include:

- write APRs
- determine work priorities
- inspect personnel for compliance with military standards

- assign maintenance and repair work
- counsel subordinates on personal or military-related matters
- plan or schedule work assignments

Not surprisingly, this job included some of the most senior people in the sample, averaging almost 16 years TAFMS. DAFSC 42672 and 42673 made up 54 percent and 10 percent of this job, respectively. Twenty-seven percent were DAFSC 42699 qualified individuals.

XI. TRAINING PERSONNEL (STG0037). Members of this job include the trainers of the AFSC 426X2/X3 career ladders. They include Field Training Detachment personnel, Unit Training personnel, and Technical School Instructors. Training tasks account for 48 percent of their total job time. Individuals in this job perform an average of 28 tasks. Representative tasks include:

- administer tests
- conduct resident course classroom training
- score tests
- annotate training records
- counsel trainees on training progress
- evaluate progress of trainees

Another rather senior job, these incumbents have an average TAFMS of 11 years. Forty-eight percent are DAFSC 42672 personnel, while 29 percent hold a 5-skill level qualification in that career ladder. Thirteen percent belong to the DAFSC 42673 specialty. As could be expected, most (51 percent) are utilized by ATC.

XII. NONPOWERED SUPPORT EQUIPMENT PERSONNEL (STG0125). Airmen in this job are responsible for maintaining nonpowered engine support equipment. Examples of these include forklifts, hoists, carts, and engine removal, installation, and transportation equipment. Maintaining these types of equipment accounts for 37 percent of their total job time. Personnel perform a job averaging 54 tasks, some of which include:

- paint and mark nonpowered engine support equipment
- perform periodic inspections of general support equipment
- clean engine trailers or stands
- inspect and service engine trailer tires
- maintain inspection status of nonpowered support equipment

Many shops have their personnel working in more than one section. In this job, for example, many individuals work in other sections such as accessory repair and small gas turbine engines. These job incumbents average almost 7 years TAFMS. Fifty-eight percent are 5-skill level qualified airmen in the AFSC 426X2 career ladder. Eleven percent of the job is composed of AFSC 426X3 personnel.

XIII. MATERIAL SUPPORT PERSONNEL (STG0110). These personnel are responsible for coordinating with Supply for needed parts and equipment. Many maintain tool cribs and bench stock listings. Performing general administrative and supply tasks accounts for 71 percent of their total job time. The average number of tasks performed in this job is only 40, some of which include:

- issue special tools
- inventory special tools, such as consolidated tool kits and tool room chits
- maintain tool cribs
- perform shift security checks of tool crib
- maintain bench stock listings
- process due in from maintenance items

Job incumbents have an average TAFMS of 8 years. Fifty percent are 5-skill level qualified in the AFSC 426X2 career ladder. AFSC 426X3 personnel represent 13 percent of this job.

XIV. PROPELLER SHOP PERSONNEL (STG1487). Members of this job repair and maintain propellers. Performing maintenance tasks on propellers accounts for 43 percent of their total job time. These individuals perform a very broad job averaging 123 tasks. Representative tasks include:

- inspect propellers or related components
- remove or install pump housings
- remove or install propeller control assemblies
- rework propeller blade nicks, burrs, or scratches
- remove or install propeller brush block assemblies
- spray paint propeller tips or blade data sections

Only AFSC 426X3 personnel hold this job. They have an average TAFMS of 7 years. Sixty-three percent are 5-skill level qualified. The vast majority of Propeller Shop Personnel (85 percent) are utilized by MAC.

XV. SMALL GAS TURBINE PERSONNEL (STG0312). Personnel in this job concentrate on maintaining small gas turbine (SGT) engines. Performing this duty accounts for 48 percent of their total job time. Due to their concentration in this area, individuals in this job perform an narrow job of only 44 tasks. These include:

- remove or install SGT engine components
- assemble or disassemble SGT engines
- inspect SGT engine components
- operate SGT engines on test stands
- analyze SGT engine operation data during test stand runs
- adjust SGT engine components

Members in this job average over 4 1/2 years TAFMS. Only AFSC 426X2 personnel were found within this job, with 69 percent being 5-skill level qualified. Half the members of this job are utilized by TAC.

XVI. TECHNICAL ORDER PERSONNEL (STG0255). Individuals in this job are responsible for maintaining TO files. Due to the specificity of the job, job members perform a very narrow job averaging only 12 tasks. Their job is so specified, in fact, that the five representative tasks listed below account for over 50 percent of their total job time:

- maintain TO publication files
- direct maintenance of TO files
- review TO changes
- initiate or review TO system forms, such as AFTO Forms 22, 27, 110, 110A, 110B, and 131
- verify receipt of TCTO changes

The average TAFMS of these job members is 10 years. Fifty percent belong to the DAFSC 42672 specialty. All AFSC 426X3 members (11 percent) are qualified at the 5-skill level.

XVII. HIGHER HEADQUARTERS PERSONNEL (STG0267). Many in this senior job are assigned at the headquarters level in nonsupervisory staff level coordination and evaluation functions. Inspecting and evaluating tasks account for 52 percent of their total job time. These individuals perform an average of 18 tasks. Representative tasks include:

- evaluate suggestions
- write staff studies, surveys, or special reports, other than training reports

evaluate Technical Order improvement reports
identify problem areas using deficiency or service reports
evaluate inspection report findings

The most senior job in the sample, these incumbents average almost 19 years TAFMS. Both career ladders are represented in this job (29 percent DAFSC 42672 and 13 percent DAFSC 42673). Fifty-eight percent, however, hold DAFSC 42699.

XVIII. ENGINE MONITORING PERSONNEL (STG0067). These job incumbents monitor the performance of engines while in flight. In other words, they analyze data on engine performance after the aircraft has flown to ensure the engine has performed up to standards. Performing these engine monitoring tasks account for 45 percent of their total job time. They perform an average of 32 tasks, some of which include:

- analyze engine performance
- update automated engine performance or maintenance data
- coordinate joint oil analysis program (JOAP) records with appropriate agencies
- report maintenance or diagnostic check requirements to flightline personnel for resolution
- review JOAP records
- manually record engine performance or maintenance data

The average TAFMS of these job members is 9 years. Half are DAFSC 42672 personnel, while the other 50 percent are DAFSC 42652 specialty members. Fifty-eight percent are utilized by SAC.

XIX. ENGINE MANAGEMENT PERSONNEL (STG0120). Engine Management Personnel control and account for the movement of engines and their status. Performing these engine management tasks account for 46 percent of their total job time. They perform an average of 61 tasks. Representative tasks include:

- maintain manual AFTO Forms 95
- update automated engine removal or installation data
- coordinate engine changes with appropriate agencies
- track repair of engines or engine modules
- verify documentation of repaired engines or engine modules
- prepare engine records for transfer

Another group of senior personnel, the average TAFMS for job incumbents is 12 years. Fifty-one percent are qualified at the 7-skill level in the AFSC 426X2 career ladder. AFSC 426X3 makes up 10 percent of the job, with 8 percent being DAFSC 42673 qualified.

Comparison of Specialty Jobs

As is readily evident from the above discussion, the propulsion specialty contains a number of different jobs covering a wide variety of tasks. Several tasks, nevertheless, were commonly performed by personnel in both the Jet Engine and Turboprop specialties. Because of this task commonality, jobs within the propulsion specialty were identified by functional area, rather than by AFSC. Within many of these functional areas, however, personnel in each of the career ladders clearly separated by AFSC into their own distinct variations. The consolidation of the two propulsion specialties into these overall jobs should, therefore, not be viewed as a call to merge the two specialties, since the two ladders distinctly separated by specialty and would assumedly separate by shreds.

The three major technical jobs identified in the career ladder were the In-Shop, Flightline, and Test Cell Personnel jobs. Most of the other jobs were small, specialized shops often located within shop or flightline functional areas. Examples of specialized jobs often functionally located within the shop area include: Balance Shop, Afterburner/Augmentor Module, Accessory Repair, Nonpowered Support Equipment, and SGT. Phase Dock Personnel, on the other hand, are usually functionally located under the flightline area.

The majority of variations identified within the specialty jobs (especially in the In-Shop and Flightline Personnel jobs) centered around engines. Individuals in these variations were found performing tasks particular to specific engine types.

Comparison to Previous Survey

The results of this survey were compared to the results of the last AFSC 426X2/X3 survey, AFPT 90-426-424, dated April 1982. Overall, the previous survey reported findings similar to those stated in the present job structure analysis. Both identified the three major technical jobs plus several other more specialized jobs. The last survey, however, separated these jobs by career ladder. For instance, the 1982 survey featured a job of "Flightline Turboprop Engine Maintenance Personnel" and another job of "Flightline Jet Engine Maintenance Personnel," as opposed to just "Flightline Personnel."

The past survey also identified several jobs by different names. The most notable is "Aircraft Servicing Personnel," which in the present survey are called "Cross Utilization and Training (CUT) Personnel." One previously listed job, not identified in the present survey, was "QEC Kit Monitors." "Engine Monitoring Personnel," on the other hand, was not identified in the previous survey. Further, "Phase Dock Personnel" and "Nonpowered Support Equipment Personnel" are two jobs formerly identified as variations under larger jobs. A final finding deals with the "Small Gas Turbine Personnel" job. The 1982 OSR had both AFSC 426X2 and 426X3 personnel within its SGT job, while the present study identified only AFSC 426X2 airmen in the job. Pockets of AFSC 426X3 personnel performing these tasks were, nevertheless, found in

the sample, but did not group in the present "Small Gas Turbine Personnel" job. A complete listing comparing the present and previously identified jobs is included in Table 3.

ANALYSIS OF 426X2/426X3 DAFSC GROUPS

In addition to analyzing the career ladder structure, examining skill levels is helpful in understanding a career ladder. The DAFSC analysis compares skill levels, highlighting differences in the tasks performed at the different levels. This information can be useful in examining how well various career ladder documents, such as AFR 39-1 Specialty Descriptions and the Specialty Training Standards (STS), reflect what career ladder personnel are actually doing in the field.

A. AFSC 426X2 DAFSC Analysis: Three and 5-skill level personnel were combined for purposes of this analysis. Both skill levels essentially perform the same functions, though some increase does occur in supervisory duties at the 5-skill level. DAFSC 42672 personnel perform a job encompassing many of the tasks done at the more junior skill levels in addition to the supervisory responsibilities that enter into their job descriptions. The distribution of skill-level members across each job is shown in Table 4. To give a sense of the progression through the skill levels, relative time spent in each duty by skill level is presented in Table 5.

The 2,720 airmen with a DAFAC of 42632 or 42652 comprise 65 percent of the total AFSC 426X2 sample. They perform a very technical job primarily dealing with performing general aircraft engine maintenance tasks (which comprise 56 percent of their total job time). A number of their tasks involve removing or installing and inspecting various engine components (see Table 6). The majority of 3- and 5-skill level personnel work in the In-shop or Flightline jobs.

The DAFSC 42672 group consisted of 1,486 individuals, accounting for 35 percent of the total AFSC 426X2 sample. Supervisory and administrative areas are the most commonly performed tasks of these career ladder members. They, however, still spend the majority of their total job time in technical duties. Only 32 percent is spent in traditional supervisory duties. Many of their top technical tasks involve inspecting engine components. They thus perform many of the technical tasks accomplished by 3- and 5-skill personnel, in addition to the supervisory tasks in their job description. Jobs employing the most 7-skill level qualified individuals include Flightline, Supervisory, and In-shop. A number of their representative tasks are presented in Table 7.

B. AFSC 426X3 DAFSC Analysis: A great many similarities exist between the AFSC 426X3 and 426X2 DAFSC analyses. As with the AFSC 42632/52 DAFSC analysis, the AFSC 426X3 3- and 5-skill level analysis will be combined. Not a great deal of difference was noted in either of their singular responsibilities. DAFSC 42673 personnel, like their DAFSC 42672 counterparts,

perform both a technical and supervisory job. Data on skill-level distribution across jobs and relative time spent in duties are shown in Tables 4 and 8, respectively.

The sample captured 585 DAFSC 42633/53 individuals, accounting for 58 percent of the total AFSC 426X3 sample. Most of their responsibilities are very technical, primarily dealing with both general aircraft engine and propeller maintenance tasks. These two duties account for 62 percent of their total job time. Like the AFSC 426X2 junior skill levels, many of their tasks involve removal or installation of engine components (see Table 9). Most work in the Flightline job.

DAFSC 42673 personnel accounted for 42 percent of the total AFSC 426X3 sample, numbering 425 members. Though supervisory tasks are clearly evident in their job description, these areas only account for 25 percent of their total job time. Their job is still primarily technical in nature. Many of their top technical tasks deal with inspecting engine components (see Table 10). Seven-skill level members thus perform both the technical tasks done by the 3- and 5-skill levels and the supervisory tasks that go along with increased experience and seniority in the career ladder. The majority of these skill level members also work in the Flightline job.

C. DAFSC 42699 Analysis: These 211 individuals make up the most senior group in the survey sample. They have shifted their job duties from primarily working on technical tasks to performing many of the managerial functions of the career ladder. Several of their top tasks deal with inspecting and evaluating, which accounts for 27 percent of their total job time (see Table 11). Their overall supervisory duties account for 71 percent of their total job time. They are primarily found in the Supervisory job (Table 4), but also make up 58 percent of the small Higher Headquarters Personnel job. A listing of their representative tasks is found in Table 12.

AFR 39-1 SPECIALTY DESCRIPTIONS FOR AFSCs 454X0A/B AND 45490 (AFSCs 426X2/X3, 42699)

Occupational survey data are also used to examine classification issues. By comparing those jobs performed in a career ladder to the Specialty Descriptions, judgments can be made about the Descriptions' completeness and accuracy.

AFR 39-1 Specialty Descriptions are intended to give a very broad description of the responsibilities held by the various skill levels within a career ladder. The most recent AFR 39-1 in the propulsion career ladder (effective 31 October 1988), specifies the new AFSC 454X0A/B and 45490 designations. Though this study has used the former propulsion AFSC designations, for purposes of this analysis, the latest AFR 39-1 for AFSC 454X0A/B will be reviewed.

When compared to survey data, the AFR 39-1 Specialty Description for the Aerospace Propulsion Specialist (DAFSCs 45410, 45430, 45450), dated 31 October 1988, accurately reflects the duties and tasks being accomplished at those skill levels. Performing the various inspections and repairs on jet engines, turboprops, and turboshafts is well covered for both shreds. One job identified in the survey and not clearly covered in the Duties and Responsibilities section is the Engine Management job. A recommended extraction from the Specialty Description is reference to turbojet missile engines. Though no tasks in the inventory specifically deal with these functions, conversations with subject-matter experts have indicated few propulsion specialty personnel working in these areas.

The Aerospace Propulsion Technician (DAFSC 45470) Specialty Description, dated 31 October 1988, is also well supported by survey data. The primarily technical nature of their job is clearly evident in the description. Turbojet missile engines are still mentioned in this description, however, and should be considered for deletion.

The AFR 39-1 Specialty Description for Aerospace Propulsion Superintendent (DAFSC 45490 and CEM Code 11300), dated 31 October 1988, generally portrays the managerial aspects of these skill levels. These are the managers of the career ladder, with many responsibilities in those areas. There is again mention of turbo engines installed on missiles, which has been recommended for removal from the specialty description. An additional area to consider removing involves the comment on the technical functions performed by these individuals. They are listed in the Duties and Responsibilities section as troubleshooting and isolating malfunctions on engines, propellers and related systems. Very few at this level, however, actually perform these technical duties.

AFSCs 426X2 AND 426X3 TRAINING ANALYSIS

Information gathered from occupational survey data is also used to assist in the development and review of formal training programs or training documents such as STSs and Plans of Instruction (POI). A particularly important factor used in analyzing these training documents is the percentage of an appropriate group, such as first-enlistment (1-48 months TAFMS) personnel, performing tasks. In addition, the secondary task factors of TE and TD ratings (as explained in the Task Factor Administration section) provide useful information.

Technical school personnel have matched nonmanagerial inventory tasks to appropriate STS and POI sections to facilitate the use of occupational survey data in ascertaining the relevance and completeness of these documents. Computer listings which display the STS or POI with matched tasks and survey data are used in the analysis to show which sections of the STS or POI are most relevant to a career ladder. Survey data may also be used to show which tasks not matched to these documents may need to be included due to the extent to which they are performed in a career ladder and their importance to training.

To aid in any further detailed review of training documents, computer product displays have been forwarded to the technical school. In addition to a summary of that information, this section contains an analysis of the first-enlistment personnel in each AFSC. Figures 2 and 3, respectively, display the distribution of AFSCs 426X2 and 426X3 first-enlistment personnel across the jobs discussed in the SPECIALTY JOBS section of this report.

Training Emphasis and Task Difficulty Data

The objective of collecting TE and TD ratings is to develop rank-ordered listings of tasks in terms of importance for first-enlistment training and in terms of difficulty. A listing of training emphasis and task difficulty data are included for each AFSC's tasks in Tables 13-16. (For a more detailed explanation of both types of ratings, see Task Factor Administration in the SURVEY METHODOLOGY section.) Tasks performed by moderate to high percentages of personnel may warrant resident technical training. TE and TD ratings, composed of the opinions of experienced career ladder personnel, are secondary factors that may assist training developers in deciding which tasks should be emphasized for entry-level training. Those tasks receiving high task factor ratings, but performed by low percentages of first-enlistment personnel, may be more appropriately planned for OJT programs within the career ladder. Low task factor ratings may highlight tasks best left out of training for new personnel, but this decision must be weighed against percentages of personnel performing the tasks and other task considerations. A final product useful in making training decisions is the Automated Training Indicator (ATI). ATI takes first-enlistment, TE, and TD data and computes training decisions based on Atch 1, ATCR 52-22.

AFSC 426X2 Training Issues

A. AFSC 426X2 First-Enlistment Personnel. First-enlistment AFSC 426X2 personnel account for 36 percent of the Jet Engine sample, with 1,526 members. Personnel in this career ladder group perform a largely technical job consisting primarily of general aircraft maintenance tasks. Performing this duty accounts for 61 percent of their total job time. Many of their tasks involve removing or installing and inspecting engine system components. Forty percent start their career in the In-Shop Personnel job (see Figure 2). They perform a job averaging 82 tasks. A list of representative tasks is included in Table 17.

B. Equipment. The AFSC 426X2 career ladder is responsible for the maintenance of a number of different engines and their personnel use several different kinds of test and support equipment in performing their jobs. Survey data can point out which engines and equipment are most used and by what group. This information can then be used by training specialists to determine which types of engines and equipment should be emphasized for first-term training. Table 18 displays those pieces of equipment utilized by 10 percent or more of first-enlistment personnel. Table 19 exhibits the percentages of first-enlistment and DAFSC groups utilizing the various engines maintained in the career ladder. A full computer listing of all engine and equipment items,

and the associated percent members utilizing, is included in the Training Extract for this career ladder. This Extract is supplied to all training and utilization personnel, as well as other interested users who require this information.

C. AFSC 454X0A (426X2) Specialty Training Standard (STS). An STS is intended to provide comprehensive coverage of tasks performed by career ladder personnel. For purposes of this analysis, the most recent STS, written since the Rivet Workforce conversion, was reviewed. To assess the effectiveness of the AFSC 454X0A STS, dated October 1988, STS sections were compared to survey data from career ladder groups, such as TAFMS and DAFSC groups. Sections containing managerial and general information areas were not reviewed. In addition to examining how well survey data supported STS items, 3-skill level proficiency codes were examined to determine how well they correspond to first-enlistment airmen percent performing levels. Lastly, analysis explored areas lacking coverage in the STS and possibly warranting inclusion.

The diversity of jobs in the career ladder (as explained earlier) has resulted in several STS items not being supported by OSR data. A career ladder spread across a multitude of jobs results in several tasks being specific to only a few jobs. The criterion set forth in AFR 8-13 (dated 1 August 1986) and AFR 8-13/ATC Supplement 1 (dated 2 March 1987) for STS review calls for items in the STS to be performed by at least 20 percent of a career ladder group, such as skill level, to justify inclusion. Because of the number of different functions being performed by jet engine personnel, several did not meet this criterion. The majority of these STS items were in Paragraph 15 - MAINTENANCE OF JET ENGINES and Paragraph 16 - ENGINE BLOCK TESTING. Most in Paragraph 15 deal with the repair of various engine components.

The number of STS items not meeting the minimum 20 percent performing standard is too numerous to discuss in great detail and involve a number of important career ladder functional areas. Those matched to tasks performed by under 20 percent of career ladder groups are included in Appendix B. As seen from this listing, though several may indeed warrant removal from the STS, a number of others should not be excluded from the STS without further review. An STS is a career ladder-wide document and should include functions being performed by career ladder members. Thus, if a job is being done in a specialty, it could be argued that the job should be covered in the STS, even though less than 20 percent perform associated tasks.

AFR 8-13 does provide some latitude in determining whether or not an STS item remains if not performed by 20 percent or more of one of the criterion groups. In career ladders whose diversity (or other factors) makes a 20 percent cutoff unrealistic, STS developers can justify and establish an alternate cutoff point and document their rationale. The following are some suggestions that ATC training personnel and career ladder functional managers can apply to make alternative approaches to the STS:

- (1) Lower the 20 percent cutoff rule to a level more appropriate to the features of the career ladder, giving rationale for the change.

(2) Use other OSR data to justify inclusion, such as high TE or TD ratings.

(3) Insert a line entry in the STS for each career ladder function, regardless of percent performing. Then, using this more broadly defined approach by functional area, apply the provisions of AFR 8-13, Section B, paragraph 12 to create an Air Force Job Qualification Standard to describe each distinct job in the AFSC.

Reviewing the proficiency codes at the 3-skill level shows how well STS coding corresponds to first-enlistment airmen responsibilities. Items matched to tasks performed by 30 percent or more of first-enlistment personnel normally should have a task performance or task knowledge proficiency code at the 3-skill level, unless additional factors dictate otherwise. This allows for inclusion of that item into 3-skill level formal resident training. Several STS items with a 3-skill level proficiency code, however, were matched to tasks performed by UNDER 30 percent of first-enlistment personnel. ATCR 52-22 states that tasks should not be formally trained if performed by under 30 percent of first-enlistment personnel (unless additional factors dictate otherwise). Many of these items are in Paragraph 12 - GENERAL ENGINE MAINTENANCE and Paragraph 15. Table 20 includes several examples. Care needs to be taken in reviewing these STS items. Career ladder diversity may have also affected many of the low first-term percentages. Subject-matter experts thus need to be attentive in reviewing these items to determine if proficiency codes at the 3-skill level should indeed be removed and thus eliminated from inclusion in the training course.

An additional area of analysis involves examining tasks not matched to any STS element. Unreferenced tasks performed by at least 20 percent of a career ladder group are performed to an extent great enough to be considered for inclusion in the STS. Table 21 lists several examples of tasks not referenced to any STS item. Subject-matter experts should examine these and other unreferenced tasks to consider incorporating their functions in the STS.

D. AFSC 45430A (42630) Plan of Instruction. POI C3ABR45430A, being the most recent 3-skill level course, was examined for this analysis. This course primarily deals with instruction in the repair and maintenance of jet engines. Training includes operating principles, engine change, adjustments, and conditioning of jet engines and systems. Additional training is provided in the removal, disassembly, inspection, repair, assembly, and installation of jet engines. Other information supplied includes ground safety practices, ground support equipment, operation of engine electrical systems, publications, forms, and maintenance concepts.

The course has two distinct Block III-Intermediate Maintenance sections. Section 000 uses the F100 engine as the training platform. Section 001, on the other hand, uses the J57 engine for training. Both sections use these engines for the general engine training and attempt to cover the same material in each training platform.

* Training Emphasis has an average of 1.72 and a standard deviation of 1.33

** Task Difficulty has an average of 5.00 and a standard deviation of 1.00

With the assistance of training specialists from Chanute AFB, this POI was matched to applicable inventory tasks. Computer printouts were then generated to display the results of the matching for use in analyzing the adequacy of the POI. Only performance objectives were reviewed in this analysis, due to their relevance to task statements.

The diversity of the AFSC 426X2 career ladder has also affected this training document. A number of POI objectives were matched to tasks performed by less than 30 percent of airmen in their first 4 years. Most were found in Block III. Additionally, several of the matched tasks had below average TE ratings. The number of POI objectives not meeting the minimum 30 percent members performing criterion is too numerous to discuss in detail. They are, however, included in Appendix B for subject-matter expert consideration.

The above finding raises some issues that need addressing. The Training Decision Logic Table in ATCR 52-22, Attachment 1, recommends those areas performed by under 30 percent of first-termers not be included in formal training. Taken at face value, this would lead to the elimination of much of the 3-skill level course. In the same manner as the STS, however, other factors (such as career ladder diversity and criticality) may lead career ladder managers to decide to retain much of the training.

Nevertheless, training managers, career ladder managers, and subject-matter experts should perform an in-depth review of the entire course to determine which, if any, of the POI objectives should be retained or eliminated. Where retention cannot be supported by OSR data, alternative justification rationale should be documented for future reference.

As with the STS, another part of the POI analysis involves examining unreferenced tasks. These are areas that should be considered for course inclusion due to high percentages of first-termers performing these tasks. The majority deal with general aircraft engine maintenance tasks. Table 22 lists these tasks. Training specialists should review unreferenced tasks performed by over 30 percent of first-job/first-enlistment personnel to determine if they should be included in common resident course training.

AFSC 426X3 Training Issues

A. AFSC 426X3 First-Enlistment Personnel. The 288 individuals in their first-enlistment within AFSC 426X3 account for 29 percent of the sample of turboprop maintenance respondents. Like their AFSC 426X2 counterparts, these airmen perform a very technical job performing many "remove and install" engine component-type tasks. They also, however, perform several general propeller maintenance tasks. This function accounts for 16 percent of their total job time. Fifty percent of AFSC 426X3 first-termers are employed in the Flightline Personnel Job (see Figure 3). This is contrary to AFSC 426X2 first-termers who commonly work in the In-Shop Personnel job. AFSC 426X3 first-termers perform a rather large job, averaging 115 tasks. Some of these are included in Table 23.

B. Equipment. Similar to the AFSC 426X2 career ladder, AFSC 426X3 personnel employ a wide variety of different tools and equipment and are responsible for several types of engines. Using survey data to identify highly used pieces of equipment and engines can help tailor training requirements to ensure knowledge in this area. Table 24 lists those pieces of equipment maintained by significant percentages of first-term personnel. These should be looked at for technical school hands-on training. Table 25 displays those engines maintained by AFSC 426X3 first-term and DAFSC groups. A complete listing of career ladder equipment usage and engines maintained is included in the Training Extract.

C. AFSC 454X0B (426X3) Specialty Training Standard (STS). The AFSC 426X3 career ladder, also having been affected by Rivet Workforce, has their latest STS identified as AFSC 454X0B. This will be the one reviewed. Like the A-shred STS, the B-shred Specialty Training Standard (dated August 1988) was compared to survey data to ascertain its soundness as a career ladder-wide training document. Sections dealing with managerial and general information areas were not reviewed. In addition to examining how well survey data supported STS items, 3-skill level proficiency codes and possible areas excluded from the STS were also reviewed.

As mentioned above, an STS item is supported by OSR data if the inventory tasks matched to that item are performed by 20 percent or more of TAFMS and/or DAFSC groups. Using this criterion, the AFSC 454X0B STS, like its A-shred counterpart, had several items not supported by survey data. In other words, several performance items were matched to tasks performed by under 20 percent of AFSC 454X0B personnel. Due to the number of items, they have been listed in Appendix B. Many of these items were in Paragraph 13 - MAINTENANCE OF TURBOPROP/SHAFT ENGINES, INCLUDING GAS TURBINE ENGINES with several referring to remove, install, and inspect items.

This lack of support could also have resulted from the diversity of jobs held by AFSC 426X3 airmen. If such is indeed the case, an alternative method, as explained in the AFSC 454X0A STS analysis, is appropriate. An STS is a career ladder-wide document, and if a specific function is being performed in the field, it should be included in its STS, regardless of the percentage performing the function. One needs to remember, however, that the data collected represent the tasks actually being performed by turboprop/shaft mechanics. Thus, if few individuals are performing a certain function, and it is not deemed as a separate function of the career ladder, serious consideration needs to be given to determining its future in the STS. Each low-performing STS item needs to be viewed with a critical eye from training specialists and career ladder managers to ensure that the STS is truly the best place to document that particular function. It is stressed that if an alternative route is traveled, proper justification and documentation be included for future reference.

The AFSC 454X0B STS has a couple of issues dealing with 3-skill level proficiency codes that need addressing. Three-skill level STS proficiency codes were reviewed to ensure that items with high percentages of first-enlistment personnel performing were coded, thus allowing for structured training. Examination of the STS revealed many items matched to tasks

AFSC 426X3 ENGINES MAINTAINED
(PERCENT MEMBERS PERFORMING)

<u>TYPE OF ENGINE</u>	<u>FIRST- ENLISTMENT PERSONNEL (N=288)</u>	<u>5-SKILL LEVEL (N=518)</u>	<u>7-SKILL LEVEL (N=428)</u>
T56 (C-130)	75	75	68
T58 (HH-3E)	8	10	13
T64 (HH-53)	8	12	14
T76 (OV-10)	8	8	10
T400 (HH-1N)	4	6	9

performed by 30 percent or more of first-enlistment personnel with no 3-skill level proficiency code that would allow for structured training at that level. These are listed in Table 26. The majority of these items are in Paragraph 18 - DIAGNOSE CAUSES OF MALFUNCTIONS. These areas, performed by high percentages of first-termers (and with high task factor ratings), and not taught in the 3-skill level course, need to be considered for addition to the entry-level course.

The other proficiency code area examined were those items coded at the 3-skill level (indicating formal training) matched to tasks performed by under 30 percent of first-job/first-enlistment personnel (see Table 27). Due to the low numbers of junior personnel making use of these skills and knowledges, training specialists need to consider dashing these items at the 3-skill level, resulting in removal from the course.

A final area of analysis involves examining tasks not matched to any STS item. Tasks performed by 20 percent or more of a major group (i.e., TAFMS or DAFSC group), but unreferenced to the STS, should be considered for STS inclusion. Several tasks deal with performing general engine and propeller maintenance tasks. Examples of these and other unreferenced tasks are listed in Table 28. Subject-matter experts should review these tasks to see if any areas need adding on to the STS.

D. AFSC 454X0B (426X3) Plan of Instruction. The latest DAFSC 42633 POI is C3ABR45430B, and will be the one reviewed in this analysis. This turboprop course shares many of the same topics as the jet engine course. Essentially, the course provides instruction on the disassembly, inspection, repair and assembly of turboprop engines. Propeller maintenance is also covered here, with training being given in the operation, removal, disassembly, inspection, repair, assembly, test and installation of hydraulically operated propellers, controls and assemblies. Other topics covered include ground safety practices, ground support equipment, electrical fundamentals, publications, forms, and maintenance concepts.

The majority of POI objectives matched to OSR tasks was performed by 30 percent or more of first-job/first-enlistment personnel, signifying generally good support for the POI. Several objectives, however, were matched to tasks done by under 30 percent of these criterion groups. The publication of an OSR is an excellent opportunity for training specialists to review these identified unsupported objectives and consider their future in the training document.

A complete listing of these unsupported objectives is found in Appendix B. As can be seen, the majority of these objectives is found in Block IV - ENGINE REPAIR. A number of these deal with specific engine component parts worked on by relatively few individuals. Subject-matter experts need to examine all the unsupported POI objectives to determine if they should indeed be removed from the course so as to make it more representative of the tasks performed by airmen first entering the career ladder.

As with the STS, another part of the POI analysis involves examining unreferenced tasks. Based on high percentages of first-termers performing them, several tasks should be considered for inclusion in the POI. Many of these tasks deal with performing general aircraft engine (Duty G) and general propeller (Duty H) functions. Table 29 lists examples of these tasks. Training specialists should review these and other unreferenced tasks performed by over 30 percent of first-enlistment personnel to ascertain if they should be included in common resident course training. A complete listing is contained in the Training Extract, which has been forwarded to the technical training school.

JOB SATISFACTION ANALYSIS

An examination of the job satisfaction indicators for each experience group provides some understanding of factors which may affect the job performance of AFSC 426X2/X3 personnel. Job satisfaction indicators for AFSC 426X2 and 426X3 TAFMS groups are shown in Table 30. These are displayed alongside a comparative sample of similar career ladders surveyed in 1988. This gives a relative measure of how the job satisfaction of personnel in AFSC 426X2/X3 compares with other similar Air Force career ladders. Additionally, job satisfaction indicators from the previous survey were examined to seek out any changes in job satisfaction that may have occurred over time. These data are presented in Tables 31 and 32 for each career ladder. Finally, job satisfaction across specialty jobs was reviewed to determine how overall job satisfaction may be influenced by the specific job performed.

Five attitude questions covering job interest, perceived utilization of talents, perceived utilization of training, sense of accomplishment from the job, and reenlistment intentions provide indications of job satisfaction. Both specialties had high positive responses for all the attitude questions (see Table 30). The majority of indicators had positive responses of 75-85 percent in each career ladder. As shown in Table 30, this compares very favorably to a comparative sample of similar career ladders. These two propulsion specialties had slightly higher job satisfaction indicators in all areas.

Comparing the 1982 job satisfaction data to the present data shows little change over time for AFSC 426X2 TAFMS groups (see Table 31). As Table 32 shows, however, there is some noticeable change in AFSC 426X3 job satisfaction data over time. Across all questions, job satisfaction indicators have increased in this specialty over the last 7 years. This was especially evident in the first-and second-term groups.

Job satisfaction indicators for specialty jobs were also examined to identify jobs having high or low job satisfaction (see Table 33). Most jobs had very high job satisfaction indicators, thus keeping in line with the overall high career ladder indicators. A few jobs were identified, however, where many personnel indicated finding their job less than interesting. These jobs

included TO, Nonpowered Support Equipment, Material Support, and Accessory Personnel. Several of their other responses were also lower than most other career ladder jobs.

IMPLICATIONS

As explained in the INTRODUCTION, this survey was requested to update the tasks performed in the career ladders since the previous OSR (1982); and to identify what engine monitoring and engine management tasks are being done. Due to the recent Rivet Workforce initiatives, the two career ladders were converted into one ladder with two shreds. Since the survey was administered under the former AFSC designators, however, the findings have been reported under the prior classification scheme.

Comparing present and previous OSR data shows the specialty to be very stable in the jobs being performed. Three major technical jobs were identified, in addition to a number of other smaller, more specialized jobs. This resulted in some diversity in the functional areas performed by propulsion personnel. Both AFSC 426X2 and 426X3 personnel exhibited enough similarities in their duties to be able to identify jobs by functional area, as opposed to AFSC. This should not be interpreted as a recommendation to merge the two career ladders (or present shreds) since the two clearly separated within the overall jobs.

Though diversity was found in the jobs performed, examination of skill level progression shows 7-skill level qualified individuals performing many of the same tasks done by their more junior counterparts. This implies that while there is diversity in functional areas, the major repair and maintenance type tasks are performed across the specialty. The biggest impact of this diversity in jobs is on the career ladder training documents; specifically, the STSs and POIs. With so many varied functional areas employing career ladder members, several specific areas in the training documents were found matched to tasks performed by low percentages of career ladder groups. Strict interpretation of appropriate regulations would call for many of low-performing areas to be removed from the training documents.

The publication of an OSR is an excellent opportunity to make an in-depth study of these areas in the training documents to ascertain their relevance for continued inclusion in the documents. Latitude is provided in AFR 8-13 and ATCR 52-22 to have subject-matter experts examine these items and decide their fate. With proper justification and documentation, many important areas could remain in the documents.
